Patent Details:
Patent Kind Lan Pg Filing Notes Application Patent
US 5846900 A 7

Abstract (Basic): US 5846900 A

A process of forming a dye transfer image comprises
imagewise-heating a dye-donor element comprising a support having
thereon a dye layer and transferring a dye image to a dye-receiving
element to form the dye transfer image.

The dye-receiving element comprises an identification (ID) card
stock comprising a polymeric core substrate having an oriented
poly(ethylene terephthalate) film laminated on at least one side. The
card stock also has an image-receiving layer located on the outermost
surface of at least one side.

Also claimed is a thermal dye transfer assemblage which comprises:
(a) a dye-donor element comprising a support having thereon a dye
layer; and (b) a dye-receiving element comprising a support having
thereon a dye image-receiving layer. The dye-receiving element is in a
superposed relationship with the dye-donor element so that the dye
layer is in contact with the dye image-receiving layer.

Further claimed is an identification card stock as above.

USE - The card stock is used for producing ID cards, such as
drivers licenses, national ID cards, **bank** cards and **other**
authority cards.

ADVANTAGE - The ID card stock is not subject to dye-donor sticking

during the printing process. It has high flexibility and durability over an extended period of time, while retaining good stiffness and impact strength. The ID card material can have layers specifically adapted for thermal printing on both front and back sides, if desired. The invention allows the use of dye-receiving layers which function well with dye-donors designed to give high maximum density at very short line times.

Abstract (Basic): US 5733845 A

A process of forming a dye transfer image comprises: (i) imagewise-heating a dye-donor element comprising a support and a dye layer; and (ii) transferring a dye image to a dye-receiving element to form the dye transfer image.

The dye-receiving element comprises an identification card stock comprising a polymeric substrate, a hydrophobic antistatic layer, an oriented polymeric film and an image-receiving layer.

Also claimed are: (1) a thermal dye transfer assemblage comprising: (a) a dye-donor element comprising a support and dye layer; and (b) a dye-receiving element comprising a support and a dye image-receiving layer; and (2) an identification card stock.

USE - The image can be obtained from electronic devices, e.g. video camera, pictures and incorporated digitally in card stock for driving licence, national ID cards, bank cards, other authority cards, etc..

ADVANTAGE - Card stock has improved durability and processing.

Patent Details:

Patent	Kind	Lan	Pg	Filing Notes	Application	Patent
EP 794651	A1	F	12			

Designated States (Regional): DE ES GB IT

Abstract (Basic): EP 794651 A

The method involves establishing a link between first and second terminals via a telephone network (RTC). The second terminal then transmits a demand for prepayment processing. When the prepayment is accepted, the second terminal requests pre-processed payment amounts and determines the amount received.

An ID number identifies the sending terminal and is included in a control key which is generated according to a predetermined algorithm. Coherency checking is also performed between the terminals. If more than a set number of coherency checks are found, the telephone interchange does not proceed.

USE/ADVANTAGE - E.g. videotex or teletext terminal. Reduces risk of bill non-payment. User has increased awareness of call cost.

Patent Details:

Patent	Kind	Lan	Pg	Filing	Notes	Application	Patent
TW 302589	A		20				

Abstract (Basic): TW 302589 A

The method involves setting-up a safety core for a **bank** and setting-up a prime and an integer. The method then selects a secret code and uses the Diffie-Hellman algorithm to generate an open code. Personal data are then used to apply for an account and a password is selected at the **first** registration and the personal ID is set and conveyed to the **bank**. After verifying the password, the **bank** opens the **account** and gives an SG number.

The personal registration process involves inputting a core code which is combined with a personal ID to form a password. Personal account ID and a common code number are also generated and sent to the **bank**. The **bank** checks the **existence** of the **ID** and uses the secret code to obtain the SG number and R. The common code is then calculated and used to decode TR and identification.

USE - E.g. for setting-up of **bank** account.

Patent Details:

Patent	Kind	Lan	Pg	Filing	Notes	Application	Patent
JP 8099690	A		5				

Abstract (Basic): JP 8099690 A

The checking installation sets up a set of checking openings (9) along outer wall of a tank cover (2) which is used to enclose a spherical tank (1), at equal intervals. The height of installation of the openings is about the centre of upper and lower hemisphere of the tank.

A part of each check opening is fastened through a corresponding bolt and nut. Manholes (6) are installed in the tank cover for worker to enter into the space between the cover and the tank. A ladder (8a) is installed at each check opening for worker to climb into the checking opening.

ADVANTAGE - Improves safety nature. Reduces construction expenses. Requires lesser number of checking openings to be installed. Improves work quality. Prevents fire accidents due to deterioration of insulation. Is highly profitable. Achieves water light structure.

Abstract (Basic): WO 9512859 A

The bill pay system includes a payment network (102) through which participating consumers (12) pay bills (30) to participating billers (14) according to preset rules (104). the participating customers (12) receive bills (3) from participating billers (14) (e.g paper/mail bills, e-mail notices, implied bills for automatic debits etc) which indicate an amount, and a unique biller ID number (120).

To authorise a remittance, a consumer (12) transmits (2) to its participating **bank** (16) a bill pay order (122) indicating a payment date, a payment amount, the consumers account number with the biller (14), a source of funds (232) and the billers (14) ID number, either directly or by **reference** to static data containing the data elements. The system operates using an agreed set of protocols which include data exchange and message protocols as well as operating regulations which bind and direct the activities of the participants.

USE/ADVANTAGE - Allows customer to direct their **bank** , agent of their **bank** , or non-**bank** bill pay service bureau to pay amounts owed to merchants, service providers and **other** billers who bill customers for amounts owed.

Patent Details:

Patent	Kind	Lan	Pg	Filing	Notes	Application	Patent
SE 9301187	A		13				

Abstract (Basic): SE 9301187 A

The keyboard incorporates four keys and the display has a marker movable from the keyboard. One of the keys - green - activates the display so that it shows the actual text and stores selected marking in the work memory. Two keys - yellow - move the marker to the right or the left, and a third key - red - interrupts activation of the display.

The logic unit incorporates a work memory, a programme memory, clock and date function, serial communication (two channels),

comparator and is connected to the power unit, keyboard, display unit and possibly further units. The actions involved entail the booking of time, unbooking of time, the showing of bookings, the opening of the door, the closing and monitoring of the door **opening**, **checking** the user **identity**, the going into a definition mode, generating statistics per time period, setting back the work memory, setting time and date.

ADVANTAGE - Overcomes problems with known booking methods.

Abstract (Basic): SE 8605388 A

One computer is for user purposes, whilst the second functions as a control, and when a symbol combination is fed into both computers the encoding algorithm converts it to another symbol combination which on authorisation is identical for both computers. The user computer memory function contains **references** specific for the authorities to which the holder of the computer possesses access, and on activation by a person-specific code related to a selected **reference** in its display function, shows the selected **reference** in the form of a third symbol combination. The computer, when activated by the person-specific code related to a selected **reference**, converts by an encoding algorithm and an encoding key the selected **reference** to a fourth symbol combination which is presented in the display function. The control computer, using the encoding algorithm and encoding key, converts the fourth symbol combination to a **reference** giving access to authorities, which **reference** is shown in the computer display function. The encoding algorithm and key are time-variable time-variable.

USE - To **establish** entitlement of person to use **account** card, obtain cash from **bank** account, have access to locked premises or to data system. (Provisional basic advised week 8831)

US 4750181	A		11			

Abstract (Basic): US 4750181 A

The data integrity checking method samples the data input to a circuit being checked. The data output from the circuit being checked is sampled. The data sampled in steps A and B is **compared** for **identity**. A positive **compare** signal is issued and a **new** circuit **checking** operation is commenced if an **identity** is detected. These steps are repeated enough times to assure passage of data completely through the circuit. A negative compare signal is issued and a **new** circuit **checking** operation is commenced if an **identity** is not detected within a given maximum number of comparisons.

ADVANTAGE - Eliminates need for second elastic buffer; greater reliability and smaller physical size.

Abstract (Basic): DE 3738304 A

An image sensor detects an image on the note and generates data which is stored. The type of note is determined by computing its width from the image data. Positions of characteristic regions of each note type and **reference** patterns corresp. to patterns of the regions for each note type are stored. The type of note is further tested by calling up the test pattern, detecting image data corresp. to the characteristic regions as identification data and comparing this with the **reference** patterns.

ADVANTAGE - Rapid, reliable testing is achieved using only data necessary.

ABSTRACT

PROBLEM TO BE SOLVED: To make burglar prevention more effective by permitting an engine not to be started, and permitting shift locking not to be released when the **ID checking** of a key is not **established** .

SOLUTION: In this vehicle burglar prevention device, when an user inserts a key 1 into a key cylinder to start an engine, an immobilizer 5 does not permit an engine control unit 6 to **start** the engine unless the **ID checking** of a key is **established** , and furthermore does not permit a shift lock control unit 7 to release its shift locking either, by letting the function of burglar prevention be made more effective, when the **ID checking** of a key is not **established** , even if it were erroneously permitted by the engine control unit 6 side to start the engine, a vehicle is thereby made immovable by letting a shift lever be permitted not to be shifted from a P range.

ABSTRACT

PURPOSE: To enhance crime-preventing effect by providing a means of checking ID cards again by an ID discriminator within a given time period and also of NG judgement after checking results by ID discriminator are OK in cases where ID checking is made by threat of a criminal.

CONSTITUTION: The number of ID card is read for checking, and when the checking results are OK, a card reader 1 to unlock an electric key 2b is provided. In the **second ID checking**, an interface to send out alarm signals when operating opposite-direction read of the ID card is provided for the reader 1. Also, when the ID card is operated unavoidably, the ID card is inserted into the reader 1 in the usual direction to unlock the key 2b. Furthermore, the ID card is again inserted into the reader 1 from the opposite direction within a given time period for NG judgement to send out an alarm signal to the crime-preventing center. The occurrence of unusual state can thus be notified without knowledge of the criminal.

ABSTRACT

PURPOSE: To save a customer the trouble of going to a **bank** for the purpose of cancelling his account or depositing money again except for a special demand and to omit the processing of account cancel and redeposit on the **bank** side by automatically determining a new interest at the time of expiration of a term of the deposit account.

CONSTITUTION: This system is provided with a first storage means 9a where the interest for each deposit **account** is stored, a **second** storage means 8b where an interest calculation formula preliminarily determined for each deposit account is stored, and a third storage means 9c where **reference**

interest information independently determined by a **banking** organ is stored; and at the time of expiration of the term of the deposit **account** , a **new** interest is determined in accordance with **reference** interest information stored in the third storage means 9c and the interest calculation formula which is stored in the second storage means 9b and is preliminarily determined for each account, and the interest for each account stored in the first storage means 9a is rewritten with the new determined interest to automatically update the account whose term expires.

ABSTRACT

PURPOSE: To minimize risk in safety control and to releave the burden on operators by providing the **first** communication line which requires no secret code **checking** and the **second** communication line which requires secret code checking and properly using them depending on importance level.

CONSTITUTION: By communicating through the **second** communication line 2B, upon selecting communication line 2, which requires secret code input, for example, with respect to the money order slip with high importance level, the communication control accompanied by high safety level is obtained which requires confirming both a secret code and FAX-ID. Relating to the money order slip with lower importance level, the communication control which performs simple **confirmation** only by FAX-ID , requiring no secret code input, can be obtained by releaving operator's burden. While properly using two communication lines 2, the communication control with higher safety level is obtained for transmitting important money order slips and that with the risk in safety control suppressed to a minimum is obtained for transmitting less important ones.

ABSTRACT

PURPOSE: To equally allocate a CPU to each program even when a lot of programs approximating characteristic values are simultaneously executed at the dynamic dispatching system of a computer system.

CONSTITUTION: This system is composed of an initial area setting means 5 to set initial values to an input/output characteristic judging value storage area, executing program number storage area and input/output program ratio storage area, in the case of starting the system, executing program number updating means 6 for updating the executing program number storage area in the case of **starting** /ending the program, **individual** priority **checking** means 7 to **check** priority for each program concerning all the programs in the case of sampling and to set a value to an input/output characteristic program number storage area, and input/output specifying and judging value checking means 8 to check the value of the input/output characteristic judging value storage area. Thus, the throughput of the system is improved by equally allocating the CPU to each program regardless of the characteristics of the programs to be simultaneously executed.

ABSTRACT

PURPOSE: To prevent oblique paper feed and paper jamming by providing two feed rollers and two starting end sensors having **individual** motors as driving sources, **checking** ON/OFF state of the **starting** end sensors and controlling both feed rollers.

CONSTITUTION: Sensors 6, 7 for detecting the left and right heads, respectively, of a paper are provided. When the sensor 6 detects the left head of a paper and the sensor 7 does not detect the right head of the paper, a left feed roller 4 is stopped and a right feed roller 5 is driven whereas when the sensor 7 detects the right head of paper and the sensor 6 does not detect the left head of paper, the right feed roller 5 is stopped and the left feed roller 4 is driven. The left and right feed rollers 4, 5 employ individual motors as driving sources. According to this constitution, oblique suction of paper or paper jamming can be prevented

ABSTRACT

PURPOSE: To suppress the expansion of damage at the time of losing a magnetic card by permitting the use of plural magnetic cards for an account and setting up the payment limit amount to the amount to be paid within a fixed period in each magnetic card.

CONSTITUTION: At the time of newly **opening** an **account** and using plural, e.g. two magnetic cards, acids **identification** (ID) information 102, 106, payment limit amount information 104, 108, payment total amount information 105, 109, and master ID information 103, 107 are added to an account file. The use of plural magnetic cards for an account is allowed and an user is allowed to optionally set up the payment limit amount to be used in each magnetic card. Consequently, damage generated when the magnetic card is stolen can be suppressed at its minimum.

ABSTRACT

PURPOSE: To automatically identify the type of a subscriber storing switchboard and also to automatically test the ID /NID calling propriety by **checking** the ID **opening** and the **opening** of the originating subscriber identification number based on a fact whether the signal received from a station or a special signal received from a called terminal should be detected.

CONSTITUTION: The NID calling is carried out to a test telephone number based on the identified type of a switchboard. In case a switchboard A is recognized with a PB circuit, for example, an access code of the PB signal and an originating subscriber identification number are transmitted and the DT of a relaying system telephone service company is confirmed. Then the test telephone number is transmitted. Then only those signals which are received from a special terminal set at the called subscriber side and included within a certain fixed voice band are monitored. Thus it is

recognized that the NID calling is possible only when the relevant signal is detected. In such a way, the type of a subscriber storing switchboard is automatically identified and the propriety can be automatically recognized for the opening of the ID of a subscriber line and the opening of the originating subscriber identification number

ABSTRACT

PURPOSE: To prevent the interruption of the exchange of data due to a wrong call by switching the lines of a data communicating device to have a private line and a spare line after an ID number from an opponent side is confirmed.

CONSTITUTION: When a second line switching device 23 receives a reception and connects the lines, a first line switching device 22 sends a prescribed ID number from an ID number notifying means 29 towards the second line switching device 23. Then, a **checking** means 30 of the **second** line switching device 23 **checks** whether the prescribed ID number and the received ID number coincide or not, and when the ID numbers coincide, a switching means 31 switches a connecting line to a spare line 21. Since, when the reception from except the first switching device 23, namely, the wrong call is executed, the ID number is not sent or the different ID number is sent, the second line switching device 23 can recognize that the reception is not from the first line switching device 22, and the device 23 does not switch the connecting line to the spare line. Thus, the interruption of data communications can be prevented.

ABSTRACT

PURPOSE: To eliminate the need to use other expensive devices and to omit troublesome operation for replacing a CPU by utilizing a two-port RAM which can be accessed from both of a main CPU and a local CPU.

CONSTITUTION: The two-port RAM on a printed board which can be accessed from both of the main CPU 1 and local CPU 3 is utilized, and a test program is passed from the main CPU 1 to the local CPU 3 through the two-port RAM 2 for checking. Thus, the test program is passed from an external terminal to the main CPU 1, which transfers the test program to the two-port RAM 2; and the local CPU 3 accesses the transferred program and runs the test program to **start checking individual** peripheral devices. Consequently, the test program is run to inspect the printed board without remounting any CPU on an in-circuit emulator.

ABSTRACT

PURPOSE: To authorize an electronic card on which plural pieces of **individual authorization** information are stored securely by reading one optionally specified pieces of **individual authorization** information and deciding whether the information is approved or not.

CONSTITUTION: The electronic card is loaded in an **individual** card **authorizing** device and a password number is inputted on its keyboard and sent to the electronic card, and the number is compared with the password number set in PIN memory, thereby displaying an OK signal when they coincide with each **other**. Then, a number corresponding to a desired credit card company is inputted and sent to the electronic card to read the company code corresponding to the number out of an **individual authorization** information memory to **check** whether the company code is registered in an associative card company memory or not. When it is judged that the company is registered, the account number of the company is read out of the electronic card and compared with the storage contents of an ineffective card account number list memory; when it is judged that the account number is not an ineffective **account** number, a normal transaction is **started**.
